WEEK 10 — HADHI VARDHANI K

A separate table named **Measures** was created in Power BI using the Enter Data option. This table is used to keep all the DAX measures organized in one place for the real-estate analytics dashboard.

The **Total Properties Sold** measure was created using the following DAX formula:

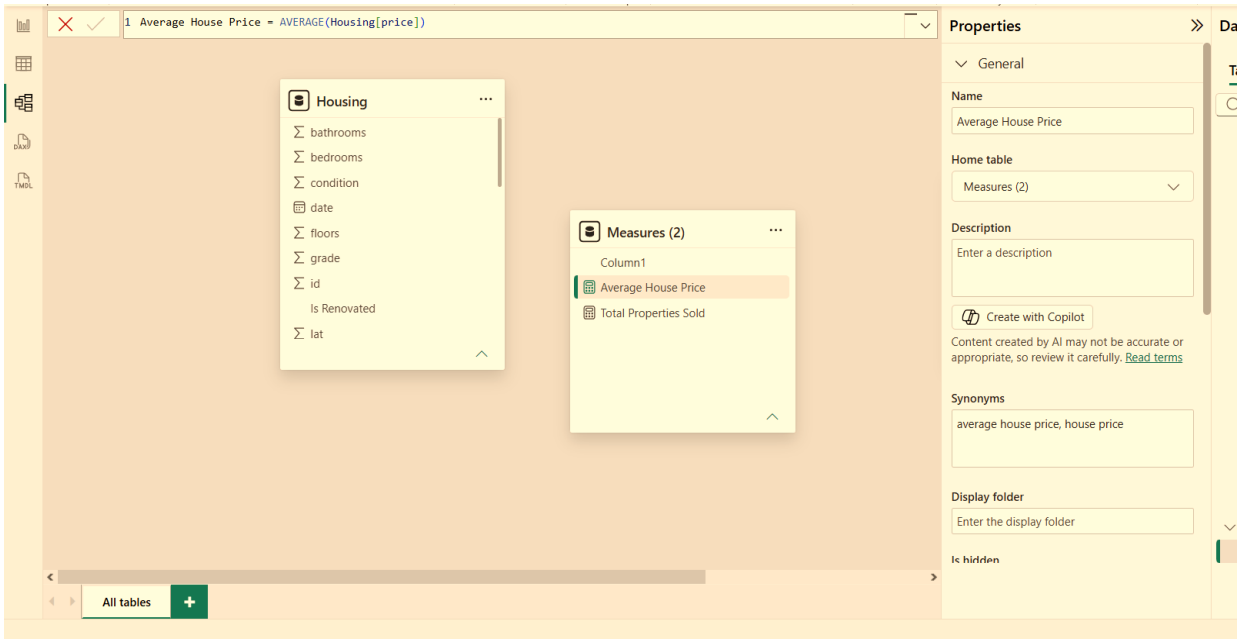

Total Properties Sold = DISTINCTCOUNT(Housing[id])

This measure counts the unique property IDs in the Housing table and gives the total number of properties in the dataset.

The **Average House Price** measure was created using the AVERAGE function:

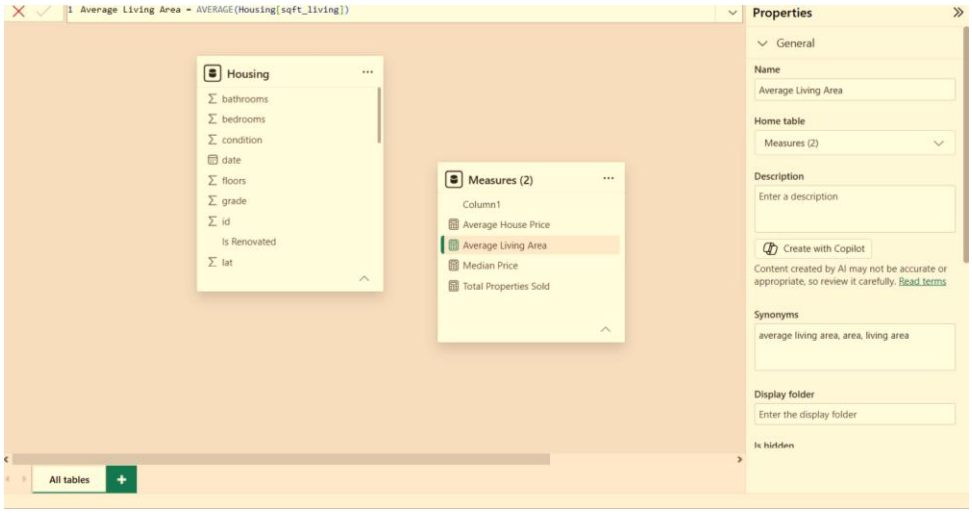

Average House Price = AVERAGE(Housing[price])

This measure calculates the average sale price of the houses in the dataset. It can be used in the dashboard to get an overall idea of property prices.

Next, I created the **Median Price** measure using the MEDIAN function:

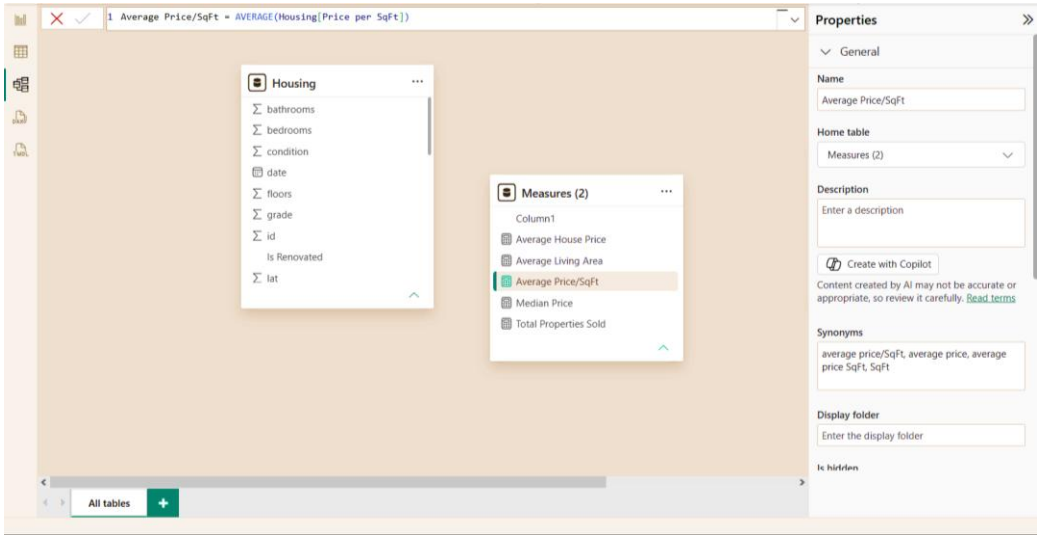

Median Price = MEDIAN(Housing[price])

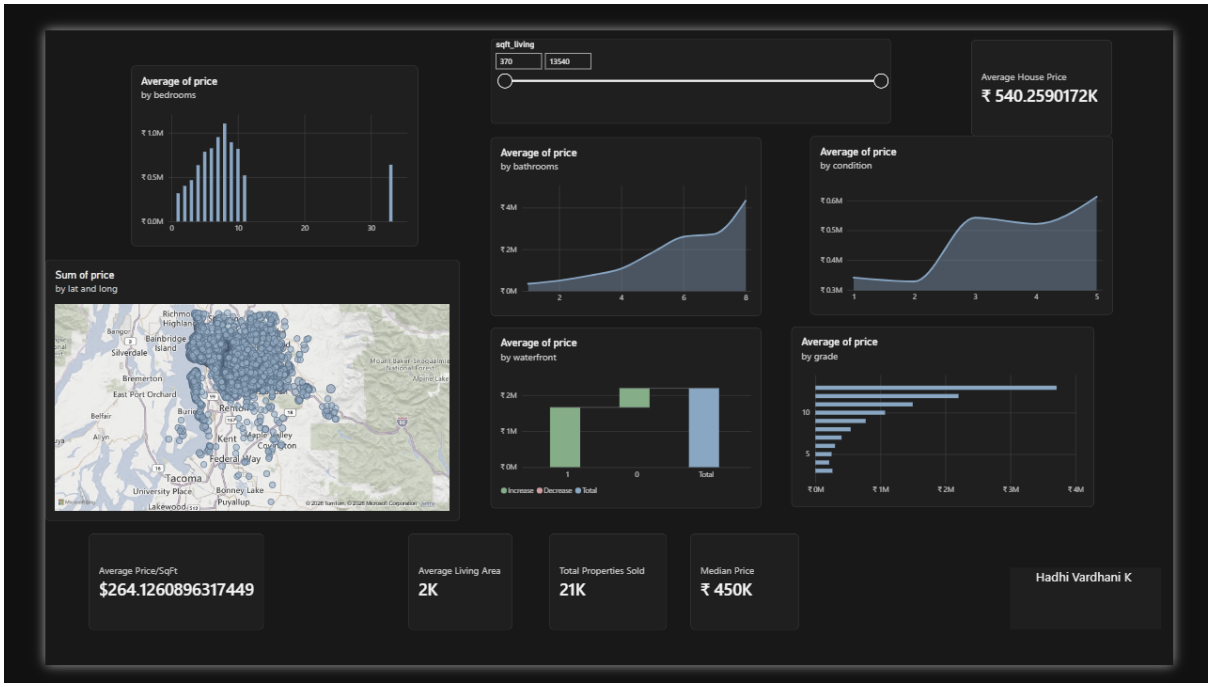

Finally, the **Average Living Area** measure was created using the following DAX formula:

Average Living Area = AVERAGE(Housing[sqft_living])

This measure calculates the average living area of the properties in square feet. It can be used to understand the typical size of the houses included in the dataset.
